

The Cutter Incident: How America's First Polio Vaccine Led to the Growing Vaccine Crisis
a book by [Paul A. Offit](#)

Amazon review by [Whale.to](#) (still up as of Feb 2011):

The Cutter disaster was completely unnecessary which is what Dr Offit will never tell you, as polio is/was a man made disease, from DDT which got into the milk supply or circulating in the air from crop spraying (as shown by researchers: Jim West, Ralph R. Scobey, M.D., and Morton S. Biskind, M.D.) and medical injections such as antibiotics and vaccines themselves. Yes, vaccines were and are a major cause of polio!

"The vaccination programs are irrelevant to the decline of polio, while pesticides correlate perfectly with polio. The unfunded, ostracized theory of poison causality far exceeds all other theories in simplicity, exactitude, and directness regarding correlations within all data areas: dosage, physiology, etiology, epidemiology, economics, and politics."--Jim West

Salk vaccine was easily proven useless, cases went up after they introduced it and they hid the fact by calling it something else! Aseptic meningitis.

and they knew it was useless:

"Go to your medical library, and ask to see the United States Polio Surveillance Unit's bulletins, from 1955 to 1970.

They will be listed as "missing".

Every single medical library in USA, that someone checked out for me, and New Zealand (and possible other countries) has them listed as "missing".

There is only one place you can see them, as far as I know, and that is in the AMA library, and they are listed as having top security clearance requirements to see, according to someone who tried to access them.

Why might this be? When he was alive, Dr Ratner had copies of them at his home. He gave me many of the years' data I wanted. They clearly showed that from the inception of the SALK vaccine, to it's discontinuation, the vaccine had MINUS efficacy and was actually causing more polio in the vaccinated than in the unvaccinated.

Any studious person looking at Government stats in retrospect, would be able to easily see that the political and media canonization of SALK and his vaccine was a mirage of duplicity upon duplicity."-----Hilary Butler

The vaccine was a great racket to hide the effect of DDT, as can be deduced by the man who headed up the March of Dimes, Dr Kumm. During World War II he had served as civilian consultant to the Surgeon General of the U.S. Army in Italy, directing field studies for the use of DDT against malarial mosquitoes in the marshes near Rome and Naples!!

And the fad for tonsillectomies made it worse, hence bulbar polio and iron lungs.

so how can you prevent pesticide attack with a vaccine? They even went around spraying with DDT as

they said it was spread by flies!!

secondly, they knew it was toxic but went ahead and released it anyway!

"In 1954 Bernice Eddy was fifty-one years old. Born in a mining town in West Virginia, she got a Ph.D. in 1927 from the University of Cincinnati and came to Washington during the Great Depression to work at the Hygienic Laboratory, as she continued to call it. Her job from then until she retired in 1973 was the safety testing of vaccines.

In 1954 the rush was on. Her lab had gotten samples of the inactivated polio vaccine to certify on a "due-yesterday" basis. "This was a product that had never been made before and they were going to use it right away," she recalled. She and her staff worked around the clock. "We had eighteen monkeys. We inoculated these eighteen monkeys with each vaccine that came in. And we started getting paralyzed monkeys." She reported to her superiors that the lots were Cutter's, and sent pictures of the paralyzed monkeys along as well. "They were going to be injecting this thing into children."

William Sebrell, the director of the NIH, stopped by the animal house where they were working, not to thank her for blowing the whistle but to ask if she and her co-workers wanted their children immunized with the vaccine, as it was in short supply. "I thanked him but said that my children had escaped polio so far and that I preferred to wait until the testing program was over before having them immunized," said Eddy. "Everyone there turned down the offer."

She heard nothing more about her report and never got the photographs back. "They went ahead and released the vaccine anyway, a lot of it. The monkeys they just disregarded." From: [The Health Century](#)

But they had to didn't they, as it was cover for the pesticide industry, no matter how many thousands of kids they killed or maimed.

A recent example of this racket is covering up phosmet poisoning of cows with 'prion disease'.

They also knew it could be prevented with Diet, as Dr Sandler proved in his classic book: DIET PREVENTS POLIO by Benjamin P. Sandler, M.D.

But we can't have anyone knowing about the importance of diet and nutrients in disease, can we? It would destroy Allopathy and all the drug houses.

He likes to spin the lie that these sort of incidents are in the past because things such as testing have improved no end, which is a complete fallacy. Now we have a huge epidemic of mostly vaccine induced autism in 1 in 100 children, plus an epidemic of vaccine induced asthma. Which doesn't say much for vaccine testing does it?!

Also the better testing gets the more they realise how inadequate the tests are, SV40 virus being a classic example, see [The Virus and the Vaccine: Contaminated Vaccine, Deadly Cancers, and Government Neglect](#)

"In 1960 Bernice Eddy, a government researcher, discovered that when she injected hamsters with the kidney mixture on which the vaccine was cultured, they developed tumors. Eddy's superiors tried to keep the discovery quiet, but Eddy presented her data at a cancer conference in New York. She was

eventually demoted, and lost her laboratory." ----Debbie Bookchin and Jim Schumacher

that is the actual reality of vaccine safety, they put them on the market whatever, and test them on every kid who has a vaccine, the MMR Urabe vaccine being a classic example as well. After it was withdrawn in Canada as unsafe, they then introduced it into the UK!! And that was when we first heard about Dr Wakefield and his research about it inducing bowel disease!

Read [Callous Disregard: Autism and Vaccines: The Truth Behind a Tragedy](#). The title sums up vaccinators such as Dr Offit. Also Silenced Witnesses Volume II: The Parents' Story.

"The entire vaccine program is based on massive fraud". --- Russell L. Blaylock, M.D.

13 Things You Didn't Know About Polio

1. In the 1800's a popular wallpaper called Paris Green was infused with a potent pesticide. Some of the most toxic substances known to man: copper and arsenic or lead and arsenic.
2. This pesticide worked by causing neurological damage in the bugs, causing organ failure.
3. Polio consists of symptoms synonymous with neurological damage, causing organ failure.
4. Heavy metal poisoning from lead, mercury and other similar heavy metals manifest lesions on neurological tissues, meaning the toxin destroys the nerve/communication pathways connecting the brain to the organs in the body.
5. Polio victims present lesions on neurological tissue, that cause the organs to malfunction all around the body. (lungs, heart, nerves that control walking etc)
6. Polio outbreaks hit throughout the summer, only during pesticide spraying times. (not the sunless and damp winter/spring seasons like other disease outbreaks)
7. Polio had NO ability to spread from infected victims to the uninfected. Polio infected clusters of people in the exact same areas, suddenly and swiftly.
8. Parents report finding their children paralyzed in and around apple orchards. One of the most heavily pesticide sprayed crops of the time (with lead arsenate or copper arsenate) were apple orchards.
9. President Roosevelt became paralyzed over night while on his farm in the summer, which contained many crops, including apple orchards. He also swam the day prior in a bay that was heavily polluted by industrial agricultural run off.
10. Dr. Ralph Scobey and Dr. Mortimer Biskind testified in front of the U.S Congress in 1951 that the paralysis around the country known as polio was being caused by industrial poisons and that a virus theory was purposely fabricated by the chemical industry and the government to deflect litigation away from both parties.
11. In 1956 the AMA (The American Medical Association) instructed each licensed medical doctor that they could no longer classify polio as polio, or their license to practice would be terminated. Any paralysis was now to be diagnosed as AFP (acute flaccid paralysis) MS, MD, Bell's Palsy, cerebral palsy, ALS (Lou Gehrig's Disease),

Guillian-Barre etc etc. This was orchestrated purposely to make the public believe polio was eradicated by the polio vaccine campaign, but because the polio vaccine contained toxic ingredients directly linked to paralysis, polio cases (not identified as polio) were skyrocketing...but only in vaccinated areas.

12. The first polio vaccine was worked on by Dr. Jonas Salk and human experiments using this vaccine were conducted purposely on orphans in government/church run institutions because they were vulnerable and didn't require any parental consent signatures, as they had no parents. The vaccine was "declared safe" by "medicine" (as they always are) and that vaccine gave 40,000 orphans polio, permanently paralyzed hundreds and killed at least 10 children. All injuries and deaths under-reported of course by the same authorities who orchestrated the atrocity. This was called The Cutter Incident.
13. The next "improved" polio vaccine, given to hundreds of millions, carried both the SV 40 cancer virus as well as the AIDS virus. Every step of the way, medicine declaring they know for sure, that this time, they have everything straightened out. Same story then, same story now.

One of the most common lines of argument offered by vaccine apologists as “proof” of how effective mass vaccination programs were in vanquishing polio is to argue that there are no “iron lung” machines anymore. The logic goes something like this: “Do you see anymore iron lungs anywhere? No, right? Well, that’s because, thanks to vaccines, we eradicated polio from this country. No more polio, ergo no need for iron lungs.”

<http://www.thevaccinereaction.org/.../iron-lungs-still-around.../>

<http://www.thevaccinereaction.org/2017/05/iron-lungs-still-around-theyre-called-ventilators/>

In his article “Why Are ‘Anti-Vaxxers’ Even a Thing?” retired pediatric cardiologist Deane Waldman, MD wrote:

Medical students today are taught about polio but strictly as a historical note. There are no more iron lungs or people being crippled by the polio virus. Why? Because of mass vaccination programs and herd immunity.¹

Most vaccine apologists who pursue this logic are not so explicit. Their argument is expressed in a more nuanced manner. The reasoning is implied. Here’s a good example by Harry Pellman, MD, a clinical professor of pediatrics at the University of California...

Many remember the 1950s and the horror of polio. Every summer in every big city in the United States, hundreds of children were paralyzed by this silent virus that killed the nerve cells in the spinal cord, causing painless, permanent paralysis. Some were so severely affected that they lived the rest of their lives on their backs in a metal tube called an iron lung. Every city had a hospital floor full of children trapped in iron lungs. The list of horrors that I have seen from illnesses that we can prevent by vaccination goes on and on.²

With brief historical references such as this, vaccine apologists seem to believe they provide

sufficient “evidence” to demonstrate the effectiveness of vaccines, thereby eliminating any reason for anyone to doubt in the wonders of these pharmaceutical products.

An article by health reporter Jonel Aleccia in 2013 titled “60 years in an iron lung: U.S. polio survivor worries about new global threat” featured a big black and white photograph of five-year old Martha Ann Lillard in an iron lung machine in 1953. Aleccia noted that the number of people in the U.S. using iron lungs had “dwindled steadily since 1959, when more than 1,200 people in the U.S. relied on the machines that use negative air pressure to passively move air in and out of lungs weakened or paralyzed by the virus.”³

Aleccia ended the article by quoting Lillard, who had spent most of her life in an iron lung: “I think the word is to get your child vaccinated. Why would we let somebody have to go back through that again?”³

The message is clear: Vaccines saved us from polio, thus dramatically diminishing the need for those dreadful iron lungs. Although the machines benefited thousands of people who suffered from acute breathing problems, the image they conveyed was rather horrific, which had the effect of unnecessarily amplifying the fear of polio. According to one account: *They looked like the tin man to me. They looked big to me. And their heads stuck out. There was a starkness there. You lined up, you waited for your name to be called. It wasn't a pleasant experience.*⁴

What exactly were iron lungs? They were negative-pressure machines used for mechanical ventilation—essentially, respirators.⁵ Iron lung machines resembled small decompression tanks. People who had suffered paralysis of muscles in their lungs and were unable to breathe on their own were placed in iron lungs, which provided artificial respiration until they were able to breathe independently again.

*Better known as the iron lung, this metal cylinder completely engulfed the patient up to the neck. A vacuum pump created negative pressure in the chamber, which resulted in expansion of the patient's chest. This change in chest geometry reduced the intrapulmonary pressure and allowed ambient air to flow into the patient's lungs. When the vacuum was terminated, the negative pressure applied to the chest dropped to zero, and the elastic recoil of the chest and lungs permitted passive exhalation.*⁵

The first iron lungs, also known as *artificial lungs* or *artificial-breathing machines*, were widely used for mechanical ventilation and were developed by Philip Drinker and Louis Agassiz Shaw of Harvard University in 1929.⁵ In 1939, the National Foundation for Infantile Paralysis in the United States began distributing iron lungs on a mass scale. The unit cost of the machines during the 1930s was approximately \$1,500,⁶ or more than double the cost of a new car back then.⁷

Although they have come to be popularly associated almost exclusively with polio, iron lungs were used for patients who were unable to breathe on their own due to any number of reasons, including severe pneumonia or gas asphyxiation.⁸

The narrative that iron lungs went out with the apparent taming of polio as a result of the polio vaccine developed by Jonas Salk, MD in the early-1950s is a dishonest one. As Suzanne Humphries, MD has pointed out, we still have plenty of iron lungs around, only that we now have modern versions of them called “ventilators.”⁹

Parents today think that the Salk vaccine eliminated any need for ventilators, because the pictures of all these children on iron lungs are no longer paraded in front of people in order to create fear. Besides which, today’s “iron lungs” don’t look like a prototype submarine. They are barely recognizable as today’s “ventilators.”⁹

One of the pictures to which Dr. Humphries refers is a famous one taken in an auditorium at Rancho Los Amigos National Rehabilitation Center in Downey, CA in 1953. The black and white photograph shows four rows of iron lung machines lined up side by side—a total of about 30 machines. Each machine has an adult or child in it, and there are about 10 doctors and nurses posing next to roughly every three or four machines.^{6 10 11}

The impression one gets by looking at the photo is that that must have been what it looked like in hospitals throughout the U.S. at the time. Not true. The scene for the shot was staged for a polio information film produced for the March of Dimes campaign.^{10 11}

Two data points sometimes used to show the decline in the number of people requiring iron lungs are that in 1959 there were 1,200 people in the U.S. using the machines and that by 2004 the number had dropped to only 39.⁶

While that may be true, it doesn’t tell the whole story. According to The American Association for the Surgery of Trauma (AAST), in 2005 there were “790,257 hospitalizations involving mechanical ventilation” in the U.S. This represented “2.7 episodes of mechanical ventilation per 1000 population.” The average length of use of a ventilator by patients was just over two weeks and accounted for 7.1 percent of all hospital days.¹²

So, no, iron lungs are no longer as prevalent as they once were. But that has nothing to do with polio or the polio vaccine. It has to do with technological advancement. The modern-day equivalent of the iron lung, the ventilator, is in greater demand than ever before, at the same time that the American people are growing increasingly ill and disabled.
