

The US has been Polio free since 1979 - except for cases resulting from the vaccine. WHO certified the Western Hemisphere Polio-free since 1994, after no cases were reported since 1991. Surgeon General David Satcher, MD MMWR 1994; 43:720-2 (so why are we giving our kids 5 doses of Polio vaccine?)

On National Vaccination Day about 430,000,000 people are vaccinated worldwide and it is reported that 1 case per million vaccinated contracts Polio from the vaccine. The country with the highest incidence of Polio is Nigeria, with 178 cases reported as of 2003 and they now refuse the vaccine. Why? Because that number is insignificant compared to the number of people dying of malnutrition, dirty water, and lack of housing. They said that if people want to bring in \$\$\$\$, bring it to help their needs like clean water and food, etc. (Not for a disease that 98% of people recover from in 10-14 days)

What about safety? What's the harm in just getting the vaccine "in case"?

Here are the ingredients we give to American children in IPV: 2-phenoxyethanol, formaldehyde, neomycin, streptomycin, polymyxin B, monkey kidney cells, Eagle MEM modified medium, calf serum protein, Medium 199

"The most common contaminant virus found in bovine serum is a member of the pestivirus family called bovine diarrhea virus (BVDV). All commercially available bovine (cow) serum is thought to be contaminated with this virus. Vaccines grown on contaminated cells may, in turn, have viral contaminants in the final product. The animal viruses can combine with viruses in the vaccine and become an active, unique disease." REF: J Infect Dis. 1996 Dec;174(6): 1324-7. Contamination of commercially available fetal bovine sera with bovine diarrhea virus genomes: implications for the hepatitis V virus in cell cultures. (Via Saying No To Vaccines, by Dr. Sherri Tenpenny)

Besides the fact that we all know formaldehyde is a carcinogen (cancer-causing agent), the original vaccine contained SV40 monkey virus linked to cancer. We could dissect the other ingredients on the list, but we'll just move on.

Would I risk cancer which now is at an astonishing rate of 1/2.5 people over a disease that is

not around and for which 98% of people recover in 14 days? NO! How many cancer patients recover in 10-14 days? NONE!
